**INTRODUCTION**

Acinetobacter baumannii is a Gram-negative organism that has been increasingly recognized as an important opportunistic pathogen causing nosocomial infections and outbreaks, especially in patients with intrinsic resistance in regions. Carbapenem resistance in A. baumannii is often due to carbapenem-

**CONCLUSIONS**

**AMENDED ABSTRACT**

*In People’s Republic (P.R.) of China, carbapenem-resistant A. baumannii have been isolated from 2007 to 2010 in 31 hospitals according to the Surveillance by Ebis and Ager Division of National isolates (SEANIR) program, a national antimicrobial resistance surveillance program in China’s mainland. This study evaluated the antimicrobial susceptibility profiles and resistance mechanisms of carbapenem-resistant A. baumannii clinical isolates collected from China.*
