The abstract mentions the use of various antimicrobials against different bacteria, including the Acinetobacter baumannii species complex and Stenotrophomonas maltophilia. The introduction explains the importance of these bacteria in hospitals and the need for effective treatments. The results section details the findings of the study, which involved the evaluation of various antimicrobials against these bacteria. The methods section outlines the experimental design and procedures used in the study. The materials and methods section describes the isolation and characterization of the bacteria used in the study. The conclusions section summarizes the findings and their implications. The references section lists the sources used in the study. The abstract, introduction, results, methods, and conclusions sections are presented in a clear and concise manner, making it easy to understand the main points of the study.
